

CARRIER BASE

Trucking Insurance Platform

PRODUCT ROADMAP

Gap Analysis *and Roadmap.*

What has shipped, what is missing, and what comes next - prioritized for production readiness, growth, and competitive advantage in the trucking insurance market.

PREPARED FOR

**Carrier Base
Leadership**

DATE

May 6, 2026

VERSION

v1.0

LIVE URL

**carrier-
base.vercel.app**

Executive Summary

Carrier Base is a fully functional, production-grade trucking insurance CRM with FMCSA integration, CAB-style scoring, multi-policy management, drag-drop document handling, MVR ordering with wallet billing, e-signature integrations, and role-based access. The frontend is deployed at carrier-base.vercel.app and works end-to-end as a demo today.

To turn this into a billable SaaS serving real agencies, four work streams remain: (1) wire live API keys into the integration stubs already built, (2) move data from browser localStorage to a real multi-tenant database, (3) harden authentication and pass insurance-industry security requirements, and (4) layer in differentiating features that justify the \$200-\$500/month price point.

What is already built and working

- Y Full FMCSA carrier search with state browsing, New Ventures, BASICS scoring
- Y CAB-style risk scoring engine deriving grades from public FMCSA data
- Y Multi-policy account model with markets, producers, lines, premium, dates
- Y Drag-drop document uploads with auto-tagging and download
- Y Driver and Vehicle schedules with Excel import
- Y MVR ordering wired to per-user wallet with auto-recharge
- Y Renewal reports with 30/60/90 day filters and CSV export
- Y Email composer with attachments, contact picker, per-user From address
- Y Email integration scaffolding for Gmail, Outlook, Yahoo, SMTP
- Y Calendar and E-Signature integration scaffolding
- Y Notification center with bell and per-event push
- Y Cart-based checkout with Stripe scaffold and email receipts
- Y Auth system with admin panel, role-based access, password resets
- Y Geographic analytics with real US heat map and recharts

Critical: Production Readiness

These items block serving paying customers at scale. Every item in this section is a prerequisite for a real SaaS launch and contractual commitments to agencies.

Multi-tenant database and API layer

CRITICAL Effort: 6-8 weeks

Replace browser localStorage with Postgres (Supabase, Neon, or RDS). Each agency gets isolated data; users only see their org's leads, policies, and settings. Build REST/tRPC API routes for every CRUD operation currently using Zustand.

Authentication hardening

CRITICAL Effort: 2-3 weeks

Replace plaintext localStorage passwords with bcrypt and JWT or NextAuth.js sessions. Add email verification on signup, password reset via secure tokens, MFA (TOTP), and session expiry.

Live Stripe and recurring billing

CRITICAL Effort: 2 weeks

Wire STRIPE_SECRET_KEY into existing /api/stripe/checkout route. Add webhook receiver for subscription events (renewals, cancellations, failed charges). Build customer portal for self-service plan changes. PCI scope: SAQ-A via Stripe Checkout.

Live email send and reply sync

CRITICAL Effort: 3-4 weeks

Wire RESEND_API_KEY for transactional emails. Build OAuth flows for Gmail/Outlook (NextAuth + provider scopes). Implement IMAP-poll or webhook-receiver to capture inbound replies and route them to the matching lead by Reference-ID header.

Document storage migration

CRITICAL Effort: 1-2 weeks

Browser localStorage caps at ~5MB per origin - production breaks fast. Move uploaded docs to S3 / Cloudflare R2 with signed URLs. Keep metadata in Postgres. Same UI, different storage backend.

Audit logging

CRITICAL Effort: 1 week

Track every status change, policy edit, MVR order, document upload, login, role change. Required for E&O defense and SOC 2. Append-only log table in Postgres, viewable in admin panel.

Backup and disaster recovery

CRITICAL Effort: 1 week

Daily Postgres backups with point-in-time recovery. Document storage versioning (S3). Tested restore procedure. RTO under 4 hours, RPO under 1 hour.

Privacy and compliance baseline

CRITICAL Effort: 2 weeks

Privacy policy, ToS, DPA template for enterprise agencies. CCPA / state privacy law compliance (data export, deletion). NPN / state license capture for producers. E&O policy proof of coverage uploaded by each agency on signup.

Live API Integrations

Each integration in the platform is built with a working scaffold: UI, OAuth mock screen, data shape, and store actions. Going live is a matter of obtaining keys and replacing 3-5 lines per provider. The below table inventories every integration point and what it needs.

INTEGRATION	REQUIRED KEYS / SETUP	SCOPE / NOTES	EFFORT
Stripe - Subscription billing	STRIPE_SECRET_KEY, webhook secret	Test to Live mode	1 day
Stripe - One-time wallet top-up	Same key	Already wired	0
Resend - Transactional email	RESEND_API_KEY, verified domain	Receipts, welcomes	0.5 day
Gmail OAuth	GOOGLE_CLIENT_ID, SECRET	Send + reply scopes	2 days
Outlook OAuth	MS_CLIENT_ID, SECRET	Mail.Send, Mail.Read	2 days
SMTP / IMAP relay	Per-user creds (already in form)	Nodemailer + IMAP	1 day
Samba Safety MVR API	Vendor account + API key	POST /mvr/orders	3 days
DocuSign eSign	Integration key, RSA keypair	JWT auth flow	3 days
Dropbox Sign	API key	Native API simpler	2 days
Adobe Acrobat Sign	Integration key	Same pattern	2 days
Google Calendar OAuth	Same as Gmail	Calendar.events scope	1 day
Outlook Calendar OAuth	Same as Outlook	Calendars.ReadWrite	1 day
FMCSA carrier API	Already live	Hardcoded fallback OK	0

Total estimated effort to go live across every integration: roughly 18-22 working days for one engineer. Most of this is OAuth setup, webhook receivers, and reply-parsing logic. None of it requires changing the UI.

High Priority: Near-Term Must-Haves

Features that complete the day-one CRM experience for producers and agency managers. Each is high-impact, customer-visible, and reasonable in scope.

Bulk lead import

HIGH Effort: 3 days

Drag-drop a CSV of DOTs or company names; auto-enrich each from FMCSA on import. Producers buying a list from FMCSA need this on day one.

Lead deduplication and merge

HIGH Effort: 2 days

Detect duplicate DOTs at creation. Offer side-by-side merge for accidental duplicates. Producers will create accidental duplicates often via prospecting.

Activity feed per lead

HIGH Effort: 4 days

Combined timeline showing emails, status changes, doc uploads, MVRs, policy events, and notes. Right now these live in separate tabs - the timeline is the dashboard.

Tasks and follow-up reminders

HIGH Effort: 4 days

Per-lead and global task list. Due dates, assignees, recurring tasks. Sync to connected calendar.

ACORD form generation

HIGH Effort: 5-7 days

PDF generation for ACORD 25, 125, 126, 137 with merge fields from the lead. Currently the Applications page lists form names but does not produce a real PDF.

Email templates with merge fields

HIGH Effort: 3 days

Submission template, follow-up, renewal kickoff, decline notification. Producers reuse these dozens of times per week.

Saved filters and views

HIGH Effort: 2 days

Producer saves "My renewals 60 days out" or "Bound, \$50k+, TX". Becomes their default landing view.

Customer-facing portal

HIGH Effort: 3 weeks

Insureds log in to upload loss runs, sign documents, view their bound policies. Massive support-ticket reducer.

Quote comparison view

HIGH Effort: 5 days

Side-by-side quotes from multiple markets. Comparable lines, premium, deductible, exclusions. Helps the close.

Loss runs PDF parser

HIGH Effort: 7-10 days

Upload a loss runs PDF; auto-extract claim count, total incurred, paid losses, open reserves. Plays well with the CAB score and Pre-UW engine.

Producer commission tracking

HIGH Effort: 3 days

Per-producer commission rate by line; auto-calculate on bind. Manager dashboard surfaces commission earned per period.

Lead assignment and round-robin**HIGH**

Effort: 2 days

Manager auto-assigns inbound leads to producers by round-robin, by state, or by load.

Mobile-responsive layouts**HIGH**

Effort: 1-2 weeks

Most pages assume desktop width. Producers work from trucks, lots, and conferences - mobile is non-negotiable.

Field-level role permissions**HIGH**

Effort: 4 days

Producers see only their own leads (already partial via /policy "My policies"). Need this everywhere - managers see all, producers see assigned.

Medium Priority: Quarter Two Features

Features that round out the platform once the must-haves are live. Each is meaningful but skippable in the short term.

VoIP / click-to-dial integration

MEDIUM Effort: 5-7 days

Twilio or Aircall integration for calling brokers and insureds directly from the lead. Auto-log calls and recordings.

SMS messaging

MEDIUM Effort: 4 days

Two-way SMS with insureds and brokers via Twilio. Reminder texts for renewals and appointments. Insurance customers respond to SMS faster than email.

Document templates with merge

MEDIUM Effort: 3 days

Proposals, certificates of insurance, renewal letters with auto-filled fields from the lead/policy.

OFAC and sanctions screening

MEDIUM Effort: 2 days

Auto-screen new insureds against OFAC SDN list. Compliance requirement for many markets.

Telematics / ELD integration

MEDIUM Effort: 2-3 weeks

Pull driver hours, mileage, hard-braking events from Samsara, Motive, Geotab. Underwriting differentiator.

Loss ratio per market

MEDIUM Effort: 4 days

Track bound vs claims paid per market over time. Tells producers which markets are honest.

Renewal automation workflows

MEDIUM Effort: 3 days

Auto-create a renewal opportunity 90 days before policy expiration. Auto-send renewal-kickoff email if integrated. Auto-task producer to call.

Public REST API + Zapier app

MEDIUM Effort: 2 weeks

Third-party automations (Zapier, Make) for connecting to other tools. Becomes critical for agencies with existing tech stacks.

White-label / per-agency branding

MEDIUM Effort: 5 days

Agency uploads their own logo, sets primary color. Customer portal carries agency branding instead of Carrier Base.

Onboarding flow for new signups

MEDIUM Effort: 5 days

First-time wizard: connect email, import existing book of business, invite team. Drives faster activation = lower churn.

In-app help center and changelog

MEDIUM Effort: 1 week

Searchable help docs with video walkthroughs. Public changelog for new features.

Customer support tooling

MEDIUM Effort: 3 days

Intercom or Crisp chat widget. Help docs system. Ticket queue.

Future: Differentiators and Moat

Features that turn Carrier Base from "another trucking CRM" into the platform agencies cannot imagine working without. Build these once core is solid and customers are paying.

AI submission drafting

Trained on your historical broker submissions. One-click draft the email body, attach the right documents, suggest markets based on appetite plus score.

AI loss runs analysis

Upload loss runs PDF; AI extracts claims, summarizes patterns, flags risk concentrations, recommends UW questions for the producer to ask.

AI underwriter assist

Chat assistant that knows the carrier's FMCSA history, BASICS, crashes, and your market appetites. "Will Lloyd's write this account?" answered with reasoning.

Predictive renewal scoring

Model trained on your bind/lose history predicts renewal probability for each policy. Producers prioritize at-risk renewals.

Auto-quote comparison

Once integrated with carrier rater APIs, auto-rate every account against every appetite-eligible market. Push best 3 to producer.

Native CAB Reports integration

For agencies that have CAB Enterprise subscriptions, pull real CAB scores and inspection-level data alongside our derived score.

Multi-state filing tracker

IRP, IFTA, UCR, MCS-150 deadlines auto-tracked per insured. Auto-remind 30 days before each.

Producer leaderboards and gamification

Already have leaderboard page; expand with monthly contests, achievement badges, bonus tracking.

Mobile native app

iOS + Android via React Native. Click-to-dial, photo upload from truck stop, push notifications.

Dark mode

Producers working at night appreciate this; small effort, big appreciation.

Internationalization

Spanish for the US trucking market - significant Latino owner-operator population.

Industry data benchmarks

"Your bound premium ranks in the 78th percentile vs similar-size agencies." Aggregated, anonymized peer data.

Marketplace for sub-agents

Solo producers pair with established agencies for E&O, market access, mentorship. Carrier Base hosts the matching.

Embedded financing

Premium financing offered in-platform via Imperial PFS, BankDirect. Take a referral fee.

Built-in cyber liability rating

For trucking companies with growing tech stacks (TMS, ELD platforms). Cross-sell line.

SOC 2 Type II audit

Required for selling into enterprise (large fleets, MGAs, captives). 6-9 months from kickoff.

Public API marketplace

Other vendors build on top of Carrier Base. Each integration adds stickiness.

Acquisition or build-to-flip readiness

Clean codebase, documented integrations, predictable revenue, audit-ready. The above features compound into enterprise value.

Compliance and Security

Insurance is a regulated industry. Below is a checklist of compliance items that need attention before signing significant contracts. Many can be deferred until first enterprise customer; some are immediate.

Day-One Requirements

- ☐ Privacy Policy and Terms of Service published and accepted at signup
- ☐ CCPA / state privacy compliance: data export and deletion endpoints
- ☐ TLS / HTTPS enforcement (covered by Vercel)
- ☐ Encrypted data at rest (covered by Postgres on Supabase / RDS)
- ☐ PCI-DSS compliance via Stripe Checkout (SAQ-A scope only)
- ☐ Producer NPN capture and validation per state
- ☐ E&O proof-of-coverage upload per agency

Within First Year

- ☐ SOC 2 Type I report (3-month audit window)
- ☐ GDPR readiness if marketing internationally
- ☐ CCPA Do-Not-Sell mechanism
- ☐ Annual penetration test
- ☐ Incident response runbook + breach notification procedures
- ☐ OFAC SDN screening on new insureds
- ☐ TILA / Regulation Z disclosure if offering premium financing

Enterprise Sales Prerequisites

- ☐ SOC 2 Type II (12-month audit window) - required by most large fleets
- ☐ Vendor security questionnaire library (CAIQ)
- ☐ Custom DPA template
- ☐ Data residency options (US-only by default)
- ☐ Single Sign-On (SAML / Okta) for agency parent companies
- ☐ Audit log export for customer-side compliance

Pricing and Go-to-Market

A few items to revisit before opening for paid signups beyond demo accounts.

Pricing observations

Solo \$200/mo and Agency \$500/mo are aggressive vs competitors

AMS360, EZLynx, and Applied Epic charge \$80-\$200/user/month. Carrier Base bundles much more (FMCSA, MVR ordering, CAB-style scoring) so pricing is defensible - but consider a free 14-day trial with no card to lower friction.

Broker Directory \$1,000 one-time is the right model

Recurring would scare off solo producers. One-time + lifetime access feels fair. Could add a \$99/year refresh fee for updated broker contact info.

UW Consultation \$300/mo is a real differentiator

No competitor offers this. Confirm the underwriter actually exists and has hourly capacity to handle subscribers. May need to cap subscribers per consultant or hire a network.

MVR pass-through pricing is healthy

\$14.50 vendor + \$5 service fee = \$19.50 retail. Competitive with HireRight, much cheaper than buying direct. Keep it.

Go-to-market readiness

Producer demo loop

Build a 2-min Loom walkthrough showing FMCSA search, import, submit, bind. Embed on home page.

Free tier or trial

Currently signup is free until they hit a paywall - clarify what is gated and offer a no-card trial for the paid plans.

Reseller program

Offer 20-30% recurring commission to insurance influencers and trade-show speakers who refer agencies.

Trade show presence

NIIPA, IICF, MITA. Physical presence sells trucking insurance products faster than ads.

Case studies

Get three paying agencies, document their before/after, publish.

Suggested Timeline

A realistic phased rollout assuming one full-time engineer plus the product owner.

Phase 1 - Production launch - Weeks 1-6

- Multi-tenant Postgres database + REST API
- Auth hardening (NextAuth, bcrypt, MFA)
- Stripe live + webhooks + customer portal
- Resend live for transactional email
- Document storage on S3/R2
- Audit logging
- Privacy policy, ToS, NPN capture

Phase 2 - Core integrations - Weeks 7-10

- Gmail and Outlook OAuth + reply sync
- Samba Safety MVR live API
- DocuSign live integration
- Google Calendar live integration

Phase 3 - Customer-visible features - Weeks 11-18

- Bulk lead import + dedup
- Activity feed and tasks
- ACORD form generation
- Email templates and saved filters
- Customer-facing portal
- Mobile-responsive sweep
- Quote comparison

Phase 4 - Differentiators - Months 5-9

- AI submission drafting and loss runs analysis
- Predictive renewal scoring
- Public API + Zapier app
- White-label per-agency branding
- SOC 2 Type I audit
- Native mobile app

Phase 5 - Scale and moat - Months 10+

Page 13

- SOC 2 Type II
- Carrier rater integrations for auto-quote
- Telematics integrations (Samsara, Motive)
- Embedded premium financing
- Marketplace for sub-agents
- International expansion

Where we stand

Carrier Base is in an unusual position: the demo is more polished than most production CRMs, but the foundation underneath is browser-only. The work to make it real is well-defined and can be done in a sprint-and-a-half - about 8 weeks for one engineer to ship the production-ready version with live integrations.

After that, every feature on this roadmap is incremental. Nothing requires a rewrite. The architecture decisions (Zustand to API; localStorage to Postgres; mock OAuth to real OAuth) are all swap-in patterns, not rebuilds.

The differentiator versus AMS360, EZLynx, and Applied Epic is already in the box: real-time FMCSA data, derived CAB scoring, drag-drop everything, integrated MVR billing, broker directory, and underwriter consultation. The features that turn paying customers into evangelists - AI submission drafting, predictive renewals, native loss runs analysis - are quarter-three work.

Recommended immediate next step

Lock in 8 weeks of focused engineering for the Phase 1 production launch. Ship a real database, real auth, real Stripe, real email. Open paid signups on week 9. Use weeks 9-14 to onboard the first 10 paying agencies and harvest feedback for Phase 2 prioritization.

CARRIER BASE

Built for trucking insurance.

carrier-base.vercel.app - github.com/Nahalo6/carrier-base
